SOFTWARE DEVELOPER

Dedicated Software Engineer with a specialization in Java development and a desire to bring important ideas to life. Proven ability to solve complex problems effectively and bring a feature from zero to one with full ownership. Excellent communication skills sharpened by coordinating feature timelines and requirements with clients.

SKILLS

Languages	Java, JavaScript, TypeScript, Python, C++, SQL
Protocols & APIs	XML, JSON, SOAP, REST
Frameworks	Flask, React, Spring Framework, Spring Boot, Hibernate, JSP, JSTL
Tools	Git, GitHub, Docker, SVN, Mercurial, Jenkins, ChatGPT
Methodologies	Agile, Project Planning, Solutions Design

EXPERIENCE

Modern Campus <i>Software Developer</i>	July 2022 - November 2025 <i>Toronto, ON</i>
Designed and implemented new features for the Lifelong Learning product, a Student Information System enabling post secondary institutions to manage student enrollment and data using Java EE, JSP, JSTL and Hibernate, resolving over 100 tickets per year	
- Refactored and updated obsolete coding patterns and deprecated library method calls in the Lifelong Learning system to ensure security and data integrity is maintained and code re-usability is maximized - Built out a comprehensive API suite using Spring Framework to externalize key internal student data objects in a generic JSON format, allow clients to integrate the product's key data points into their own systems - Implemented a custom payment processor integration for Lifelong Learning's payment system handling transaction life-cycle management, refunds and voids, coordinating with external points of contact to define expected behavior to enable transactions for a high priority client with a tight deployment schedule - Designed and implemented custom export functionality for a priority client's custom external data management system, ensuring data is mapped correctly from LLEEE to Blue and data validity is maintained	

Oproma Inc. <i>Full Stack Software Developer</i>	March 2021 - July 2022 <i>Ottawa, ON</i>
Implemented new features for both the frontend and backend of a next generation Secure File Sharing product using Java EE for backend API development, and various Javascript library for the frontend work such as Handlebars and RequireJS	
- Coordinated with team members to meet release deadlines using an Agile methodology, driving sprint reviews on a bi-weekly basis and participating in regular stand-ups - Improved the CI/CD structure for a product in active development by implementing the Jenkins plugin for Gitlab, enforcing test coverage in merge requests and significantly reducing time spent on expensive merges - Worked with cross functional partners (sales, engineering, product) as the primary technical contact of a high visibility legacy system written in VB.net to ensure system functionality and correctness - Collaboratively established and adhered to coding standards enforced at the project level	

PROJECTS

Shot Boundary Detection Honours Project <i>Developer/Designer</i>	January 2020 - April 2020 <i>Ottawa, ON</i>
- Implemented multiple shot boundary detection algorithms in Python, Colour Histogram comparison and Edge Change Ratio using Canny Edge Detection, and analyzed their effectiveness on video game live streaming content - Documented my methodology, test data and findings in a detailed report, which concludes that the algorithms examined have practical applications depending on the camera perspective used in the test data	

EDUCATION

Carleton University Bachelor of Science, BSc Computer Science, Honours COOP, Algorithms stream, Minor in Mathematics	September 2015 - May 2020
